PROFESSIONAL PROFILE

Full Stack Engineer and Process Automation Specialist with a unique background in business and financial analysis (Public Accounting). Currently pursuing a degree in Systems Engineering, my core value lies in identifying administrative or financial bottlenecks and translating them directly into robust software solutions (Python/Flask, PHP, MySQL) and smart workflows (n8n, Gemini API). My focus is generating quantifiable and tangible value through the automation of key processes, optimizing operational efficiencies and results.

PROFESSIONAL EXPERIENCE

JUNIOR PROGRAMMER (HR & Automation) | Consejo Nacional Electoral (CNE), Caracas | April 2024 – Present

- Led the creation and maintenance of backend logic (PHP and MySQL, MVC architecture) for personnel registration systems.
 - **Quantifiable Achievement:** Reduced manual registration time from 1.2 hours to just 6 minutes and decreased manual errors by 80%.
- Developed Python scripts (Pandas, Streamlit) for cleaning and structuring critical official data, optimizing personnel management.
- Participated in the development of software solutions for the optimization and automation of critical internal HR processes.

PROCESS ANALYST / ELECTORAL TECHNICAL PROFESSIONAL
| Consejo Nacional Electoral (CNE), Caracas | 2022 – 2024

- Performed auditing of accounting records and analysis of manual processes to identify bottlenecks and risk areas.
- Used my accounting knowledge to identify critical automation needs in administrative workflows, laying the foundation for subsequent development projects.
- **Hybrid Impact:** Applied my technical and accounting knowledge in the development of the SICOFPE system (political actors' income and expense declaration) to ensure data integrity and regulatory compliance.

TECHNIQUES SKILLS

IA & AUTOMATION:

n8n (workflow engine),

Ollama,

LangChain,

LangGraph,

CrewAI,

FastAPI,

GEMINI API,

OCR.

LANGUAGES CORE:

Python,

PHP,

JavaScript (ES6+),

HTML5,

CSS3.

FRAMEWORKS & DB:

Flask,

Bootstrap,

JQuery,

MySQL,

MariaDB,

SQLAlchemy.

DATA & TOOLS:

Pandas,

Streamlit,

Google Workspace,

FEATURED PROJECTS

Financial Minister Scraper & Automation

- **Description:** A professional-grade automation system designed to monitor food product prices (Chicken, Meat, Milk, etc.) from *Dataprecio*, transforming raw web data into automated market reports.
- **Architecture:** FastAPI, Playwright (Headless Chromium), n8n, Python (Httpx), Google Sheets API, and Gmail SMTP.
- **Workflow:** A FastAPI backend triggers asynchronous scraping tasks via Playwright; structured data is then sent to an n8n webhook for logging in Google Sheets and automated email reporting.
- **Quantifiable Impact:** This automation replaces 2 hours of manual market research and re-structure data in (Excel or Google sheet) with a 100% autonomous pipeline, providing instant visibility into food price trends directly in your inbox each Friday.

n8n Name Splitter Automation for Google Workspace.

- **Description:** Developed an end-to-end automated solution to process complex Spanish names using a **FastAPI** backend and **n8n** workflows, handling composite surnames and multiple first names with intelligent **Python** logic.
- **Architecture:** n8n, **FastAPI (Python)**, **Docker**, **Google Drive API**, **Google Sheets API**, and **Gmail SMTP**.
- **Quantifiable Impact:** Reduced processing time from ~2 hours for 1,500 records (manual team effort) to just 1:46 minutes for 16,000 records. This represents a **10x** increase in data volume handled in less than 2% of the original time.

Automatic "Account Point" Generation System (Teresa Carreño Theater Foundation)

- **Description:** Automation of the document workflow for the employee management system (CRUD) through an intelligent workflow that eliminates manual bureaucracy.
- **Architecture:** n8n, **PHP (Webhook)**, **Google Workspace API (Docs, Drive, Gmail)**.
- **Workflow:** Data sent from the PHP application activates a webhook; n8n locates a template, generates a customized copy in Google Docs, converts it to PDF, and distributes it via email.
- **Impact:** Complete elimination of transcription errors, 100% automation of the pay slip creation process for contracted personnel, standardization of official documents, and

Git/GitHub,

Insomnia.

immediate response in critical administrative processes.

Intelligent Support Assistant (Telegram Chatbot)

- **Description:** A comprehensive n8n workflow was created using Ollama llama3.1:8b as the core model for decision-making and responding based on user messages, with advanced RAG (Retrieval-Augmented Generation) capabilities, human agent escalation, and Gemma 2.9b for answering frequently asked questions.
- **Architecture:** n8n, Ollama (llama 3.1:8b, Gemma 2.9b), AI Agent, Supabase Vector Store (Supabase Vector Database), and conditional logic for routing and notifications via Telegram and email to the support team.
- **Impact:** Nearly **1,000 active employees** can search for information about their insurance policies, ensuring they have access to information from trusted sources.

Intelligent Correspondence Flow Automation (HR-CNE)

- Workflow developed with n8n and Python (OCR) that uses the llama3:8B LLM to automatically classify and distribute correspondence.
- **Achievement:** 73% Operational Improvement, reducing management time from 15 minutes to just 4 minutes per document.

Inventory Management and AI Consulting (Auto Parts)

- Full Stack Application (Flask and MySQL) integrating the Gemini API to automate technical customer inquiries.
- Included Design, Development, Containerization with Docker, and Cloud Deployment (PaaS) with a CI/CD pipeline.
- **Achievement:** Increased customer service efficiency by 40%.

Personnel Management System (PHP/MySQL)

- Robust application that centralizes and organizes staff and relative data, focused on data integrity and accuracy.
- **Achievement:** Decreased registration time from 34 minutes to just 5 minutes.

Complex Name and Surname Separator

- Web application created and deployed on Streamlit to automate data cleaning and preparation for the payroll department.
- **Achievement:** Reduced manual cleaning time from 3 hours (for 2,000 records) to just 12 seconds.

Clinical Management System

- We developed a robust and comprehensive web application **PHP, MySQL, Bootstrap, JavaScript** that digitized and transformed the patient record.**Key Value:** We converted raw clinical data into performance metrics that facilitate managerial decision-making and the measurement of service efficiency.**Innovation: I integrated a Medical Agent based on LLM 3.8b** that uses clinical history to provide physicians with diagnostic and prognostic suggestions.
